¹ Some/most hybrids were not included in all the plots. Interpolated values were used to determine the "4 Plot Average" when these data were missing. When interpreting the data, realize that the 4 plot averages using missing/interpolated data are not as "strong" as they would be for averages where there are no missing data.

² Health scores are on a 1-10 scale, with 10 having the best appearance. This is a visual score at harvest which tends to favor fuller-season hybrids with greener, healthier, and better standing plants.
